

Adapter from low to high pressure

Possibility of adding contrasting agent by making a low/high pressure adapter

There is a wide range of different systems with diverse cartridges available on the market which are used to add contrasting agent to the air conditioning system. Some contrasting agent cartridges are only equipped with a low-pressure filling adapter.

The problem is that contrasting agents cannot be added to vehicles that are only fitted with a high-pressure service connection. With the following *Behr Hella Service* parts (see photo) you have the possibility of making an adapter which will enable you to add the contrasting agent via the high-pressure service connection at the vehicle. A similar, ready-made adapter is available under the part no. 8PE 351 215-261.

Tip: The adapter also makes it possible for you to connect the low-pressure side of your air conditioning service station to the high-pressure connection (*in the low-pressure pipe*) on the Renault Laguna 2 and Renault Vel Satis (refer here also to the Bulletins for these two vehicles).
