

Compressor

Multiple use

In principle a visual comparison of installation area, mounting points and size should be carried out before replacement takes place. Some replacement compressors are designed for so-called "multiple uses". This means they can be fitted into different vehicles. Except for the number of the grooves on the magnetic clutch it is 100% comparable with the "old part".

It is possible that the old compressor and the other driven components (generator, water pump etc.), have less grooves than the new compressor. When fitting the belt it is important to take care that is "adjusted". This means the run of the belt should be aligned so as to run in straight path. The illustration shows a compressor driven by an 8 groove clutch with a 6 groove belt.
