

## Crimping tool

There is a new crimping tool in the *Behr Hella Service* range which meets the requirements of new standards and requirements for setting up connections.

Tests have shown that the old barb design in combination with worm drive clamps or iron rings and surface crimp connections no longer meet these requirements. The new "bead-lock style" connections with "blister crimp" meet these new requirements. The crimping tool with the *Behr Hella Service* part no.: 8PE 351 278-001 (with hand pump, see illustration) or 8PE 351 278-011 (without hand pump) is required to set up this connection.

This tool is a great help in producing and repairing hoses and connections and meets customers requirements and wishes. Connections can be produced directly in the garage using the necessary spare parts (fittings, hoses etc.). Original parts don't have to be ordered first. This saves time for both the garage and the customer and creates flexibility. All the necessary spares and accessories as well as size tables can be found in the *Behr Hella Service* air conditioning catalogue.
