

## **Service adapter low-high pressure**

### **Additional possibility of adding contrasting agent thanks to a new low-high pressure adapter**

There is a wide range of different systems available on the market which are used to add contrasting agent to the air conditioning system. Some contrasting agent systems are only equipped with a low-pressure filling adapter. The problem here is that these systems cannot be used to add contrasting agents to vehicles that only have a high-pressure service connection available. With the *Behr Hella Service* adapter, part no. 8PE 351 216-261 (see photo), you have the possibility of producing a quick and economical connection between low-pressure and high-pressure muffs.

Tip: The adapter also makes it possible for you to connect the low-pressure side of your air conditioning service station to the *high-pressure connection (in the low-pressure line)* on the Renault Laguna 2 and Renault Vel Satis (refer here also to the Bulletins for these two vehicles).

High pressure      Low pressure
