

## ***ALFA ROMEO*** ***All models*** ***with twin-spark motor***

### **Spark plugs - Installation instructions Tightening torque**

Two different spark plugs per cylinder are mounted on the vehicles noted above.

Observe the following when changing the spark plugs. Although the spark plugs have the same wrench width (16 mm), absolutely maintain the mounting torque of the individual spark plugs because of the differing thread sizes.

If the tightening torque is not observed, the result may be damage to the spark plugs, loss of tight seals, damage to the threads, and even to damage to the motor.

Tightening torques:

central spark plug (M14 x 1.25) = 23 – 28 Nm

side spark plugs (M10 x 1.00) = 10 – 13 Nm

In this connection always pay attention to the instructions from the auto manufacturer.
