

## H15 light bulb

### Configuration

The H15 light bulb is a 12 volt, 2 filament light bulb, made with a filament each for long distance light (1) and a filament for daytime travel light (2). The output is 55 watts for long distance light and 15 watts for daytime driving light. The lifetime of the bulb is at least 4000 hours in daytime driving and is thus much higher than with an H7 standard bulb. Hella article number H15 Light bulb: 8GJ 168 119-001

### Installation possibilities

Since automatic turning on of lights is a safety factor and an additional comfort factor for the driver, modern vehicles are sometimes mass produced with the main headlights having an integrated day travel light. Distance light and daytime travel light are thus achieved in one housing module (A). These headlights are built into such vehicles as the Audi A6 and the VW Golf 6 and Touareg.

These light bulbs are also used in the Hella distance headlight-daytime travel light combination.

This light bulb module for installation in the 90 mm construction module unites daytime travel light and distance light in one precision reflector.
