

## **Mercedes**

**C-Class (W 203) Engine: 611+612**

**E-Class (W 210) Engine: 611+612**

**M-Class (W 163) Engine: 611**

### **Condenser with auxiliary cooler**

On the above mentioned diesel vehicles a heat exchanger (auxiliary cooler) has been mounted in front of the condenser (see picture). It is a low temperature heat exchanger which is connected to the the fuel cooler through a hose system. It supplies cooled water to cool the fuel down to the desired temperature.

The cooler can be release from the condenser without disconnecting the lines. The complete unit can simply be put aside when changing the condenser.
