

Opel Omega- B

2,5 Liter Turbo Diesel

From model year `98

Modification to the compressor and expansion valve

With the engine code change from model year '98(X25DT in place of 25DT) the compressor has also changed. The Denso 7SB16 replaces the Denso 6CA17. Consequently the oil quantity has reduced from 155 ml to 145 ml.

From model year '98 in all types of Omega B a changed expansion valve is fitted. The Parker valve is replaced by an Egelhoff valve. Alternatively the Hella expansion valve (8UW 351 239-111) can be fitted.

When carrying out the above mentioned repairs, the receiver dryer must also be changed. This can be obtained through Hella N°.8FT 351 195-481.

To refill the oil we recommend using our universal PAO Oil.
