## VW Golf 4, Bora, Sharan, Passat B5

## Washer fluid low level indication

One reason for the illumination of the low level indication lamp can be to high a concentration of anti-freeze or the use of distilled water.

A level-indicator sensor with pins (see picture) measures the resistance of the fluid. The resistance rises with the proportion of anti-freeze. If the resistance rises about 200KOhm the warning light illuminates. The water part must always be more than 25%. Distilled water also has a high electrical resistance and can induce some malfunctions therefore, it may not be used.

Liquit	Mixture	Anti-Freeze	Resistance
		to	
Water	undiluted	0°C	172 kO
Ethanol	undiluted	- 70°C	<b>→</b> 8
destilled Water- Ethanol	1:1	- 35°C	<b>→</b> 8
Ethanol- Water	5:1 2:1 1:1 1:2 1:3	- 55°C - 40 °C - 35 °C - 16°C - 8°C	200 kO 130 kO 105 kO 100 kO 110 kO

all results approx.
